About me

I build complete web applications and get them running in production: designed so the people using them need no manual, and so whoever inherits them can maintain them.

WHAT I DO: End-to-end development: the database, the business logic, the screens people actually use and the deployment. I also automate manual processes inside companies.

HOW I WORK: I talk the requirement through with the people who will use it, deliver in increments, ship it and document it so the project stays alive without me.

WHAT SETS ME APART: A complete industrial traceability system as my thesis + a professional internship at Agrosuper + a freelance client whose site is live and bringing in enquiries.

Experience

Freelance Web Developer

Cris Fness — Online fitness and nutrition coaching · 2026 · cris-fness.vercel.app

- Built and launched the website a personal trainer uses to win clients: it presents his service and delivers evaluation requests straight to his inbox.
- Set it up so he can change prices, services and FAQs himself whenever he wants, without depending on me or knowing how to code.

Stack: Astro, JavaScript, HTML, CSS, Vercel, Formspree, Python, Git

Software Developer — Professional Internship

Agrosuper Ltda. · Dec 2025 – Feb 2026

- Built internal applications for operational areas, replacing spreadsheets and paper records with tools the team uses every day.
- Automated processes that were previously done by hand, freeing the team from repetitive work and speeding up reporting.
- Queried and organised information from the company databases to feed those reports.

Stack: Power Apps, Power Automate, Power BI, Power FX, SQL Server, Azure Synapse

Featured projects

JAT (Just In Time) — Dispatch traceability at an agro-industrial plant

Final-year thesis, PUCV · Mar 2026 – Aug 2026

- Built the system that lets the logistics management of a food plant see, at any moment, where every truck is, which dock it occupies and how much is left to load, replacing manual tracking.
- Recorded who performed each step and when, so the full history of a shipment can be reconstructed for a food-safety audit. Each of the nine user profiles sees only what concerns them.
- Added an early warning that learns from shipment history and predicts which trucks will run late: it catches 96 out of every 100 real cases, in time for the team to react.
- Delivered management indicators on delivery compliance, delays, times per loading point and productivity per operator, computed over six months of operations.

Stack: NestJS, Prisma, PostgreSQL, Next.js 15, React 19, TypeScript, Tailwind 4, Socket.IO, Redis, Docker, Python, scikit-learn

FINRA Bot — Orientation chatbot, PUCV Faculty of Engineering

Assistant that helps students find their way inside the faculty building: it answers by text or voice where each place is and how to get there.

Stack: Dialogflow CX, JavaScript, HTML, CSS, Web Speech API

Education

Computer Engineering

Pontificia Universidad Católica de Valparaíso · 2021 – 2026 (final year, graduating 2026)

Skills

TypeScript · JavaScript · Java · Python · Power FX · NestJS · Next.js · React · Angular · Ionic · Astro · Node.js · Tailwind CSS · Prisma · PostgreSQL · SQL Server · Azure Synapse · Redis · Docker · Socket.IO · REST · JWT · scikit-learn · Power Apps · Power Automate · Power BI · Git · GitHub · Vercel · Postman · Figma · Jira · Scrum · UML

Languages

Spanish (native) · English (intermediate)
