Portfolio: portafolio-cristian-ebon.vercel.app

About me

I build complete web applications —from the data model to deployment— and leave them maintainable for whoever operates them after me.

WHAT I DO: Full stack development with NestJS, Next.js, React and Angular, relational databases with Prisma and PostgreSQL, and process automation on Power Platform.

HOW I WORK: I gather requirements directly with the people who will use the system, deliver incrementally, deploy and document so the project stays alive without me.

WHAT SETS ME APART: A full industrial traceability system with integrated machine learning as my thesis + a professional internship at Agrosuper + a freelance client in production.

Experience

Freelance Web Developer

Cris Fness — Online fitness and nutrition coaching · 2026 · cris-fness.vercel.app

- Designed and built the client's entire website with Astro 5 and deployed it on Vercel, replacing their previous Wix platform.
- Implemented the lead capture form with Formspree: validation, loading and error states without page reloads, honeypot bot filtering and working submission even with JavaScript disabled.

Stack: Astro, JavaScript, HTML, CSS, Vercel, Formspree, Python, Git

Software Developer — Professional Internship

Agrosuper Ltda. · Dec 2025 – Feb 2026

- Built internal applications on Power Platform (Power Apps, Power Automate and Power BI) for the company's operational areas.
- Automated manual processes through Power Automate flows, reducing the team's repetitive work.
- Worked with corporate relational databases in SQL Server and Azure Synapse for querying and data modelling.

Stack: Power Apps, Power Automate, Power BI, Power FX, SQL Server, Azure Synapse

Featured projects

JAT (Just In Time) — Dispatch traceability at an agro-industrial plant

Final-year thesis, PUCV · Mar 2026 – Aug 2026

- Web system for traceability, monitoring and KPIs of the dispatch area of a food plant: 16 domain entities, 9 operational roles and real-time tracking of trucks, docks and pallets.
- Built the full architecture as a monorepo (Turborepo): a NestJS API with Prisma over PostgreSQL and a Next.js 15 / React 19 frontend, dual-token JWT authentication, role-based access control, WebSockets with Redis and OpenAPI documentation.
- Integrated two decision-tree (CART) predictive models trained in Python with scikit-learn and exported as JSON rules, evaluated in TypeScript inside the API: OTIF risk with 96% recall and SAG inspection rejection risk with 99.6% accuracy.
- Developed a 180-day synthetic dataset generator —12,335 trucks and 190,371 pallets— with batch insertion, to validate the reports and train the models.

Stack: NestJS, Prisma, PostgreSQL, Next.js 15, React 19, TypeScript, Tailwind 4, Socket.IO, Redis, Docker, Python, scikit-learn

FINRA Bot — Orientation chatbot, PUCV Faculty of Engineering

Chatbot that guides students inside the building through text or voice, with speech synthesis and voice recognition in the browser.

Stack: Dialogflow CX, JavaScript, HTML, CSS, Web Speech API

Education

Computer Engineering

Pontificia Universidad Católica de Valparaíso · 2021 – 2026 (final year, graduating 2026)

Skills

TypeScript · JavaScript · Java · Python · Power FX · NestJS · Next.js · React · Angular · Ionic · Astro · Node.js · Tailwind CSS · Prisma · PostgreSQL · SQL Server · Azure Synapse · Redis · Docker · Socket.IO · REST · JWT · scikit-learn · Power Apps · Power Automate · Power BI · Git · GitHub · Vercel · Postman · Figma · Jira · Scrum · UML

Languages

Spanish (native) · English (intermediate)
